PROVA ESTRATTA

ALESSANDRO DI NOTO

23/09/26

A handwritten signature in black ink, consisting of a stylized 'A' followed by a series of loops and a final 'n'.

Encephalitis is a severe inflammatory disorder of the brain with many possible causes and a complex differential diagnosis. Advances in autoimmune encephalitis research in the past 10 years have led to the identification of new syndromes and biomarkers that have transformed the diagnostic approach to these disorders. However, existing criteria for autoimmune encephalitis are too reliant on antibody testing and response to immunotherapy, which might delay the diagnosis. We reviewed the literature and gathered the experience of a team of experts with the aims of developing a practical, syndrome-based diagnostic approach to autoimmune encephalitis and providing guidelines to navigate through the differential diagnosis. Because autoantibody test results and response to therapy are not available at disease onset, we based the initial diagnostic approach on neurological assessment and conventional tests that are accessible to most clinicians. Through logical differential diagnosis, levels of evidence for autoimmune encephalitis (possible, probable, or definite) are achieved, which can lead to prompt immunotherapy.

Three handwritten signatures are located at the bottom right of the page. The first signature on the left is written in blue ink and appears to be a stylized 'A' or 'H'. The second signature in the middle is written in black ink and is a cursive 'O' or 'X'. The third signature on the right is also in black ink and is a more complex, flowing cursive signature.
